

A. Time-varying hazard ratio (crude, counting-process)

Piecewise monthly HR for abandoners vs. those still on treatment at that instant; LOESS smooth with 95% band.
Early months: apparent HR < 1 (immortal-time artefact). Later months: HR grows, reflecting accumulated abandonment mortality.

B. Mortality HR by month of LTFU

Sequential target-trial emulation; MI-pooled; Early = deaths in first 6 months from treatment start; Late = deaths 6–60 months from treatment start

C. Late-mortality HR by subgroup

Sequential target-trial emulation; deaths 6–60 months from treatment start; MI-pooled
